

**Appendix S1.** Details of Principal Components Analyses (PCAs) conducted for local- and landscape-level attributes of study sites.

*Methods:* We used Principal Components Analysis (PCA) to reduce the number of explanatory variables to be included in statistical models. We conducted a PCA for all local-level attributes (described in main manuscript Section 2.2) and separate PCAs for landscape-level attributes (described in main manuscript Sections 2.3 and 2.5.1). We conducted two sets of landscape-level PCAs; both sets included distance to nearest woodland (any type), ancient woodland and broadleaved woodland, and proportion of land covered by agriculture, semi-natural habitats, urban areas and water bodies (main manuscript Table 1, variables 19-25). In addition, the first landscape-level PCA incorporated the proportion of land covered by woodland (any type), ancient woodland and broadleaved woodland (main manuscript Table 1, variables 13-15), whereas the second incorporated inter-patch connectivity values for these woodland types instead (main manuscript Table 1, variables 16-18). Variables in PCAs were scaled to standardise the weights of components. (Jongman, Ter Braak & Van Tongeren 1995). Different bat species are influenced differently by the proportion of different land types (and at different spatial scales); hence, the selected spatial scales for each set of landscape-level variables differed for each response variable (i.e. for each bat species and within each study area; see main manuscript Section 2.5.1) and we performed separate landscape-level PCAs for each bat species within each study area.

*Literature cited:* Jongman, R.H.G., Ter Braak, C.J.F. & Van Tongeren, O.F.R. (1995) *Data analysis in community and landscape ecology*. Cambridge University Press, Cambridge.

*Tables' legend:* Loadings of Principal Components obtained from local and landscape-level PCAs for each bat species within each study area.

*Figures' legend:* PCA biplots showing the most relevant Principal Components for local and landscape-level PCAs for each bat species within each study area.
